## Weight Management in Pregnancy

---

### **Background**

Most women will have a straightforward pregnancy and birth and have healthy babies; however, being underweight or overweight increases the risk of complications to both mother and baby.

All women should have their height and weight measured, using calibrated equipment in the hospital antenatal clinic, and Body Mass Index (BMI) calculated at the beginning of pregnancy and this should be documented in the maternal records, recorded on MUMS and used when generating the customized growth chart. Women should not be repeatedly weighed during pregnancy. Weight should only be measured if clinical management can be influenced or if nutrition is a concern.

---

### **Achieving and maintaining a healthy weight**

At the earliest opportunity, for example at the first face to face contact, eating habits and physical exercise should be discussed. Advise about the importance of healthy diet, lifestyle and target weight gain for the developing pregnancy.

Women should be advised that a healthy diet and being physically active will benefit both her and her unborn child and they are more likely to achieve and maintain a healthy weight before, during and after pregnancy if they:

- base meals on starchy foods such as potatoes, bread, rice and pasta, choosing wholegrain where possible
- eat fibre-rich foods such as oats, beans, peas, lentils, grains, seeds, fruit and vegetables, as well as wholegrain bread, brown rice and pasta
- eat at least five portions of a variety of fruit and vegetables each day, in place of foods higher in fat and calories
- eat a low-fat diet and avoid increasing their fat and/or calorie intake; eat as little as possible of fried food, drinks and confectionery high in added sugars (such as cakes, pastries and fizzy drinks) and other food high in fat and sugar (such as some takeaway and fast foods)
- eat breakfast
- control the portion size of meals and snacks, and how often they are eating
- make activities such as walking, cycling, swimming, aerobics and gardening part of everyday life and build activity into daily life – for example, by taking the stairs instead of the lift or taking a walk at lunchtime
- minimise sedentary activities, such as sitting for long periods watching television, at a computer or playing video games
- Walk, cycle or use another mode of transport involving physical activity.

Weight loss programmes are not recommended during pregnancy as they may harm the health of the unborn baby.

Women should be advised that moderate-intensity physical activity will not harm her or her unborn baby; at least 30 minutes per day of moderate intensity activity is recommended.

Advice about being physically active during pregnancy should include:

- recreational exercise such as swimming or brisk walking and strength conditioning exercise is safe and beneficial
- the aim of recreational exercise is to stay fit, rather than to reach peak fitness
- if women have not exercised routinely they should begin with no more than 15 minutes of continuous exercise, three times per week, increasing gradually to daily 30-minute sessions
- if women exercised regularly before pregnancy, they should be able to continue with no adverse effects.
