

TRUST CLINICAL GUIDELINE

FETAL SIZE & GROWTH

A1022 OB US 2

1. INTRODUCTION

- 1.1 The aim of the obstetric ultrasound guidelines is to ensure access to a uniform obstetric ultrasound programme which conforms to an agreed level of quality. The aim of this protocol is to inform clinicians and sonographers about the ultrasound assessment of fetal size and growth. The fetal charts used to assess fetal size and growth are those recommended by the British Medical Ultrasound Society (BMUS) (BMUS 2009).

2. DEFINITIONS

2.1 An ultrasound assessment of fetal morphometric measurements usually performed in the third trimester in situations where there is increased risk or clinical suspicion of growth discordance, or where routine clinical method of growth assessment is unreliable.

3. ROLES AND RESPONSIBILITY

Post/Group	Details	Resources	Review/ Monitoring	Implementation	Records	Reporting
Midwives	<ul style="list-style-type: none"> following this and associated policies/procedures taking reasonable care of self and others 			X	X	X
Obstetric Ultrasound Committee	<ul style="list-style-type: none"> responsible for policy review examine and assist in the composition of audit reports 		X			

4. ASSESSMENT

- 4.1 For all clinical presentations assess and report on:

4.1.1 Fetal viability

4.1.2 Presentation of the fetus

4.1.3 Placental site

5. INDICATIONS FOR ASSESSMENT OF SIZE AND GROWTH

- 5.1 Women who present with:

- A history of a previous small for gestational age baby (<10 centile)
- Twins / multiple pregnancy - see [Ultrasound Management of Twin/Multiple Pregnancies](#)
- Clinically small for gestational age (below 10th centile on symphysis fundal height charts) >3 cm below expected.
- Clinically large for dates (above 90th centile on symphysis fundal height charts)

- Static symphysis fundal height chart measurements (for 3 weeks or more)
- Chronic maternal disease (hypertension, systemic lupus erythematosus, renal disease, diabetes)
- Pregnancy associated hypertension or preeclampsia
- Maternal Body Mass Index (BMI) > 40
- Maternal Body Mass Index (BMI) < 18
- Women with large fibroids.

6. ASSESSING SIZE AND GROWTH

6.1 Measure and report:

6.1.1 Head circumference (HC)

6.1.2 Fetal abdominal circumference (FAC)

6.1.3 Femur length (FL)

6.1.4 Liquor Volume (LV) - state as normal if subjectively so

6.1.5 Amniotic Fluid Index (AFI). 4 vertical measurements - one in each quadrant, to be measured if LV is subjectively abnormal. In twins and multiple pregnancies the deepest pool of each foetus is to be measured and reported.

6.1.6 Estimated fetal birth weight (EFBW) if requested.

6.1.7 Fetal stomach and bladder to be indicated as seen.

6.2 All measurements and comments to be recorded on the Computerised Radiology Imaging System (CRIS) obstetric report.

6.3 Doppler study of both umbilical arteries **to only be undertaken** if:

6.3.1 FAC is on or below the 5th centile or there is significantly asymmetric growth

6.3.2 There is a significantly reduced rate of growth on a serial scan

6.3.3 Reduced amniotic fluid with unknown cause (AFI <7cms)

6.3.4 Increased AFI volume (> 28cms or DP >8cms)

6.3.5 Diabetic mother

6.3.6 Chronic / acutely raised BP

6.3.7 If the Doppler is abnormal then it is good practice to assess the MCA Doppler to assess cerebral redistribution, but this may be difficult if the head is deeply in the pelvis.

7. INDICATIONS FOR RESCANNING

7.1 Rescan if:

7.1.1 FAC lies on or below 5th centile

7.1.2 Requested as part of a antenatal care plan

7.1.3 Static growth on FAC graph

7.1.4 Reduced amniotic fluid with unknown cause (AFI <7cms.)

8. TIMING FOR RESCANS

- 8.1 FAC/HC should not be measured at less than 2 week intervals, unless there is concern that previous measurement may have been inaccurate (in certain fetal positions and where there is oligohydramnios the accuracy of measurements may be compromised).
- 8.2 Perform an intermediate scan in one week or as required for LV/doppler study of the umbilical arteries if there is significantly abnormal growth and /or the LV and/or Doppler study of the umbilical arteries. If there is abnormal end diastolic flow (absent or reversed) a consultant should see the result and decide when follow up is required.
- 8.3 Two scans with normal growth, LV & doppler study of the umbilical arteries do not automatically require a rescan. This will be the decision of the referring clinician. Please include **rescan at your request** on the report.

9. TRAINING

*Level of training required	Staff Group / s	Division / Department	Frequency of training / update	Method of training delivery	Lead and department responsible for provision of training
A	Midwives, Obstetricians, Sonographers	Women and Children's	Once	Cascade of guideline	Lead sonographer, PDM

*Levels of Training

A = Awareness (Micro-teach, drop in session, e-learning)	B= ½ day (2.5 – 3 hours) (workshop, training event, e-learning)	C = Full day (5-6 hours) (workshop, training event)	D= Course (more than one day training)
--	---	---	--

10. MONITORING OF COMPLIANCE
